TECHBIO IN FRANCE · OCTOBER 2026 LIST · 48 COMPANIES

# A thin market, carried by a handful of names

Funding, investors and company profiles for the 48 French TechBio companies on the October 2026 list, from the Navigator database checked against the national company registry.

Data as of 10 November 2026 · amounts in € millions, as recorded · equity rounds only unless stated · Interactive version: https://claude.ai/artifact/HP1GyrsYouAdUHGaZdp54A (private unless shared)

| €1.05bn | 34 / 48 | 68% | €15M |
|---|---|---|---|
| raised across 68 recorded equity rounds | companies with at least one recorded round; 14 have none | of all money went to 4 companies: Owkin, DNA Script, Aqemia, Bioptimus | median total raised, among the 31 companies with disclosed amounts |

## What the data says

01 **Money is extremely concentrated.** Owkin (€270M) and DNA Script (€265M) alone account for half the total, all of it raised in 2022 or earlier. The top 10 hold 85%. Below them, the typical company has raised a few million euros.

02 **Deal count kept rising after the 2021 peak.** 2021 has the most money (€308M) but only 4 rounds. Rounds then climbed every year to 13 in 2024, and 2025 held at 10. The four 2026 rounds so far (Biolevate, WhiteLab Genomics, Rivercell, Generare) already total €89M, at an average of €22M a round.

03 **Series A rounds are getting bigger.** The median Series A tranche was €13M up to 2021, €15.5M in 2022–23, €20M in 2024 and €24M in 2025–26. Seed rounds peaked at a €5.5M median in 2024. Samples are small (2 to 10 rounds per period), so read this as direction, not precision.

04 **Bpifrance is the one constant.** The state bank is in 11 of the 34 funded companies and leads 10 rounds. No private investor appears in more than 5. Of 138 distinct investors, 111 back just one company on the list.

05 **Generalist tech VCs have taken over the early rounds.** Since 2024, 22 of 25 rounds with named investors included a generalist or deeptech VC (HCVC, Alven, Daphni, Kima, Better Angle, Galion.exe). None was backed only by life-sciences specialists, against 3 of 17 rounds up to 2021.

06 **Foreign money is common.** 20 of the 34 funded companies have at least one foreign investor, most often American (Y Combinator, Khosla, GV, Illumina Ventures, Bristol Myers Squibb) or British (LocalGlobe, Atomico, Entrepreneurs First).

07 **It is a Paris-region story.** 35 of the 48 companies sit in Île-de-France and hold 97% of the money. The 13 regional companies have raised €26M between them, and 9 of them have no recorded equity round.

08 **The cohort is young.** 26 of the 48 were registered in 2021 or later, and 10 since 2024. Funded companies took a median of 2 years from registration to their first round. Most are small: only 4 had 50 or more staff in the 2024 registry data.

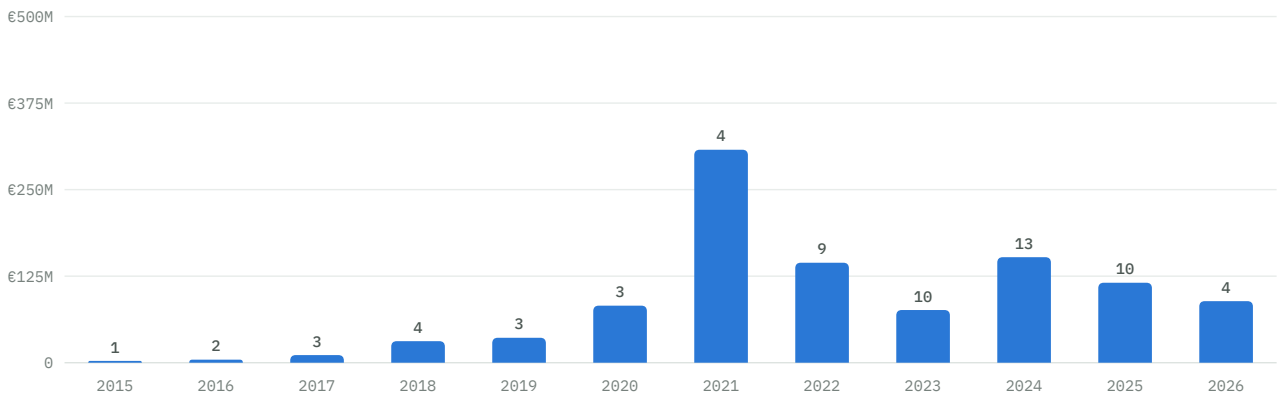

09 **Most of the science comes from public labs, and the patents are concentrated.** 28 of the 48 companies have a documented link to French public research, and 25 hold patents. DNA Script and Eligo account for half of the 195 patent families. The AI-first companies mostly have neither: the 12 foundation-model and data companies hold 16 families, 12 of them Owkin's.

10 **Brussels has been a bigger grant-giver than Paris.** 15 companies received €31M from EU research programmes, against €1.35M from the French research agency (ANR) as company partners. Five won an EIC Accelerator grant of about €2.5M each: Cherry Biotech, Qubit Pharmaceuticals, Iktos, InSpek and Scienta Lab.

11 **Four companies are in court proceedings.** Ksilink (September 2026) and Poietis (January 2025) are in judicial liquidation. Iktos (October 2026) and Ariana Pharma (September 2026) are in receivership, which lets them keep trading while a court-appointed administrator looks for a rescue. Iktos had won a €2.5M EIC Accelerator grant in 2024.

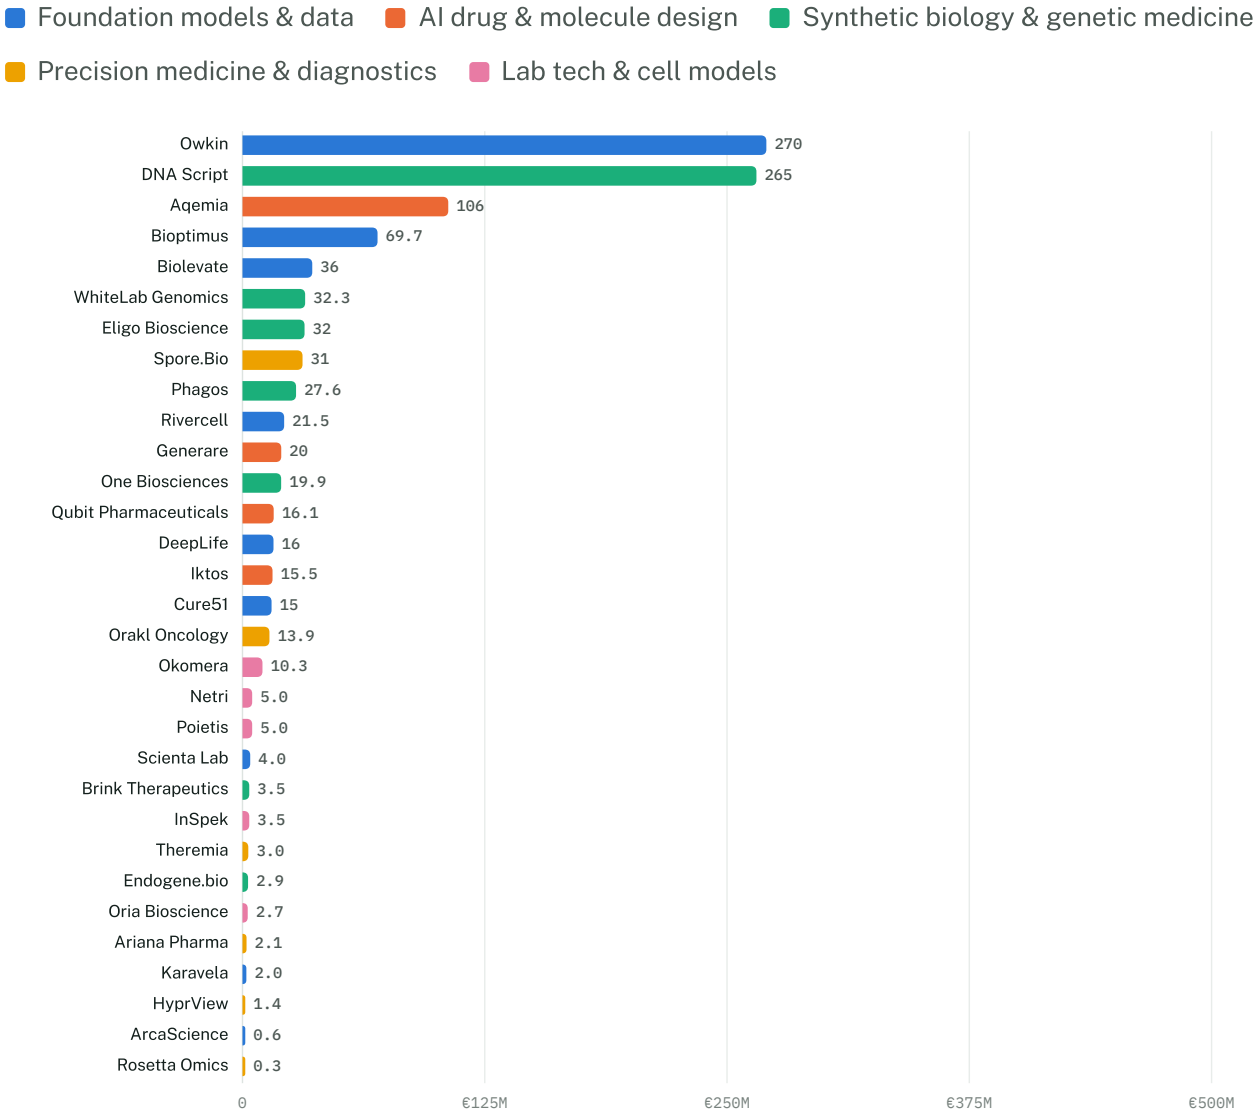

## Money raised per year

Disclosed equity amounts by announcement year; the label above each column is the number of rounds. One 2008 round (Ariana, €2.1M) is not shown.

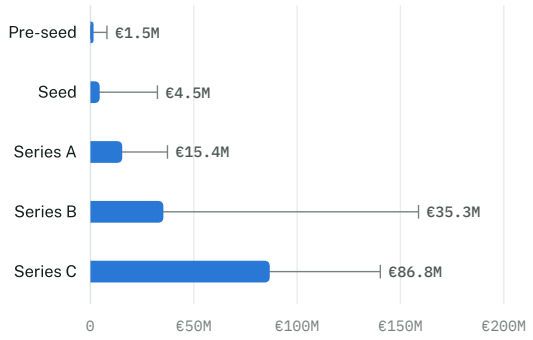

## Total raised per company

The 31 companies with a disclosed amount, coloured by what they do. Grants are excluded.

## Typical round size by stage

Median disclosed amount; whiskers show the smallest and largest round.

## Who is in the rounds

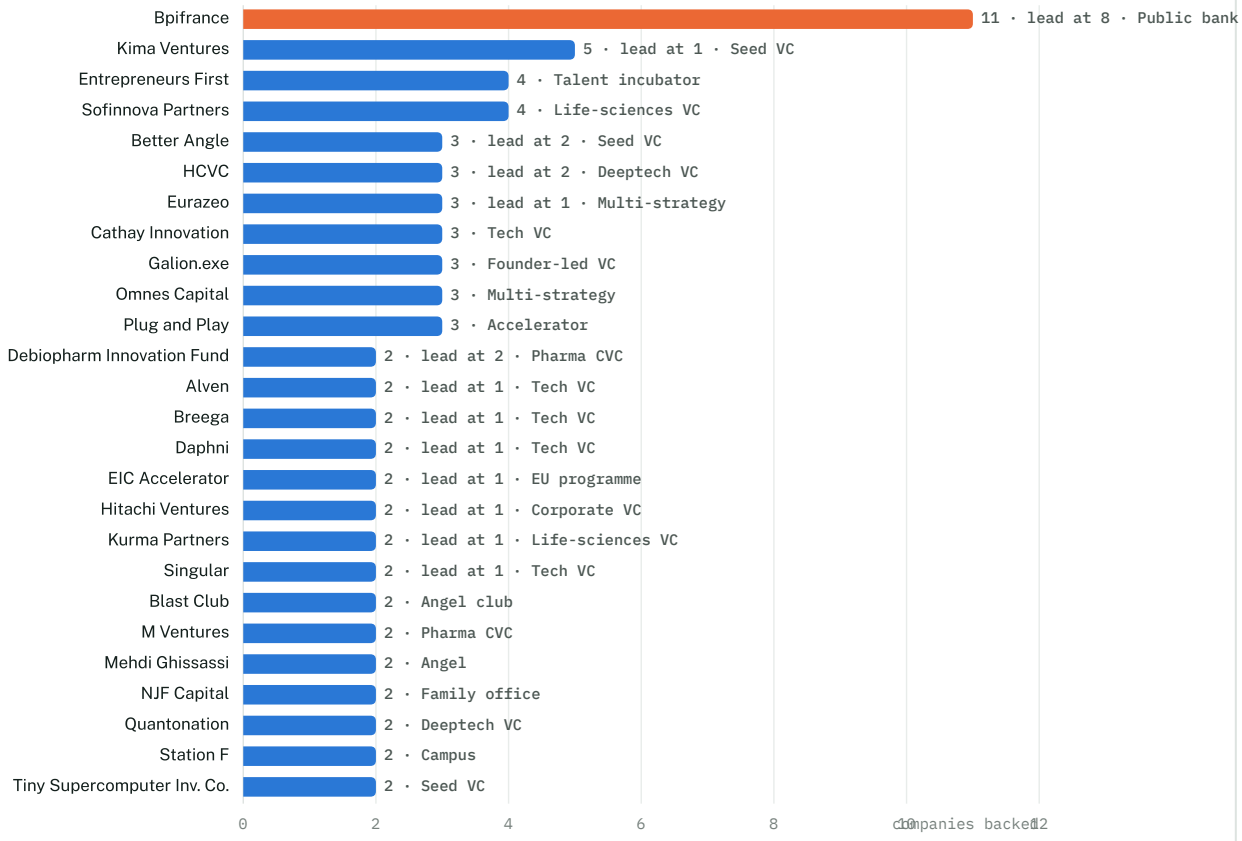

Share of rounds with named investors that include each type of backer.

| ROUNDS INCLUDING… | ≤2021 | 2022–23 | 2024–26 |
|---|---|---|---|
| A generalist or deeptech VC | 13 / 17 | 16 / 18 | 22 / 25 |
| A life-sciences specialist or pharma investor | 7 / 17 | 8 / 18 | 10 / 25 |
| Life-sciences investors only | 3 / 17 | 2 / 18 | 0 / 25 |
| A foreign investor | 10 / 17 | 13 / 18 | 14 / 25 |
| Bpifrance | 6 / 17 | 3 / 18 | 8 / 25 |

Investor types assigned by hand. Eurazeo and Omnes, which run healthcare funds, are counted as generalists.

## The most active investors

Investors backing two or more companies on the list, with the number of those companies where they led a round. Hover a bar to see which companies.

# Five kinds of TechBio

The list mixes quite different businesses. Grouping them by what they do shows where investors have put their money. The grouping is ours, based on each company's description.

| SEGMENT | COS | WITH A ROUND | TOTAL €M | MEDIAN €M | MEDIAN FOUNDED | LARGEST |
|---|---|---|---|---|---|---|
| Foundation models & data | 12 | 9 | 435 | 16 | 2023 | Owkin (€270M) |
| AI drug & molecule design | 12 | 5 | 158 | 18.1 | 2020 | Aqemia (€106M) |
| Synthetic biology & genetic medicine | 8 | 7 | 383 | 27.6 | 2019 | DNA Script (€265M) |
| Precision medicine & diagnostics | 9 | 7 | 51.7 | 2.5 | 2023 | Spore.Bio (€31M) |
| Lab tech & cell models | 7 | 6 | 26.5 | 5.0 | 2020 | Okomera (€10.3M) |

- **Foundation models and data platforms** are the newest group (median registration 2023) yet have already drawn €435M, led by Owkin (€270M) and Bioptimus (€70M). This is where the big recent cheques go: Bioptimus, Biolevate (€36M) and Rivercell (€21.5M).
- **AI drug and molecule design** splits in two. Aqemia has raised €106M in equity (plus a €6.9M France 2030 grant), while 7 of the 12, mostly regional computational chemistry shops such as InSiliBio, AI-biopharma and MAbSilico, have no recorded round.
- **Synthetic biology and genetic medicine** has the largest total (€384M) and the highest median (€28M), because these companies need labs and longer development cycles.
- **Precision medicine and lab tech** raise small rounds (medians of €2.5M and €5M). Ksilink, a phenotypic drug-discovery lab in Strasbourg, is in judicial liquidation.

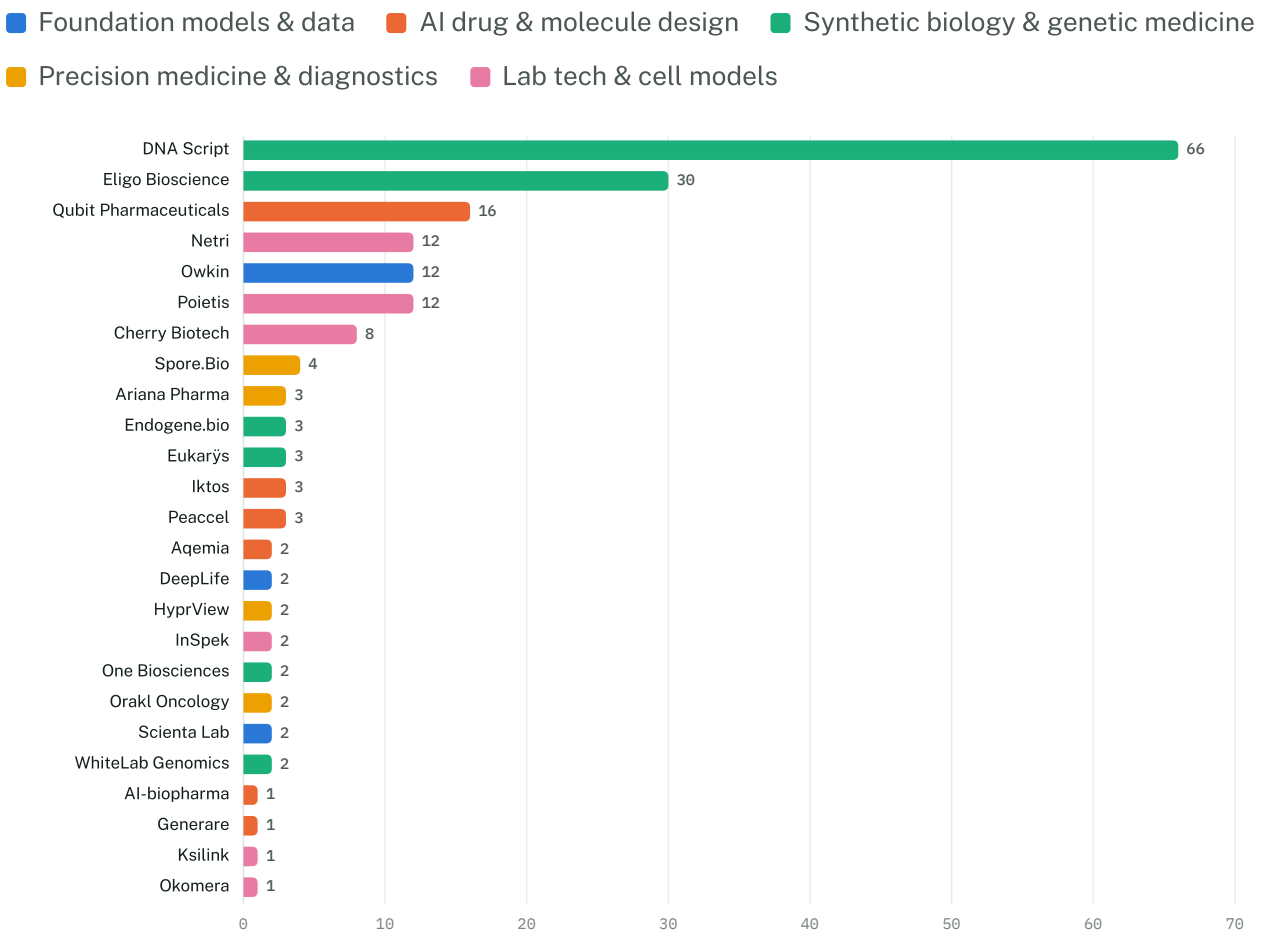

# Where the science comes from

Patents, public-research links and public prizes, drawn from French government open data: the research ministry's patent-applicant and "start-ups from public research" datasets, the i-Lab, i-Nov and i-PhD laureate lists, and ANR grant records.

| 28 / 48 | 30 / 48 | 25 / 48 | 25 / 48 |
|---|---|---|---|
| have a documented link to a French public lab, university or hospital | are on the ministry's official list of start-ups from public research | hold patents: 195 patent families in all | won an i-Lab, i-Nov or i-PhD prize |

## Patent families per company

The 25 companies with at least one patent family. A family groups the filings for one invention across countries. The other 23 companies have no patent family in the data.

- **Patents follow the wet lab, not the algorithm.** The 8 synthetic-biology and genetic-medicine companies hold 106 families. The 12 foundation-model and data companies hold 16, twelve of them Owkin's. Bioptimus, Rivercell, Biolevate and Cure51 have none. Where the ministry records the type of intellectual property transferred, Aqemia, Orakl and InSiliBio declare trade secrets rather than patents.
- **Filing has picked up.** 37 of the 195 families were filed in 2024 or later, mostly by younger companies. Qubit Pharmaceuticals filed 9 of its 16 since October 2024, all with the CNRS and Sorbonne Université, and Netri 5 of its 12. Spore.Bio, Endogene.bio, Orakl and Scienta Lab filed their first patents in 2025–26.
- **Institut Pasteur is the standout institution.** It co-owns DNA Script's core enzyme patents (five families, with the CNRS) and Eligo's two founding families, and Ariana Pharma was spun out of it in 2003. Eleven companies have a public lab, university or hospital as a co-owner of at least one patent.
- **Agoranov is the common incubator.** 16 of the 30 companies on the official public-research list were incubated at Agoranov, the Paris public-research incubator. Paris Biotech Santé incubated another 5. Eight of the 30 (Brink, DeepLife, DNA Script, Eligo,

Iktos, Rivercell, Rosetta Omics, Spore.Bio) are listed only because a public incubator supported them, with no parent lab recorded, so they shouldn't be described as spin-offs of a particular institution.

- **Public research money comes before the private rounds.** As academics, founders of 12 companies led or took part in ANR research projects worth about €8.4M to their labs, €5.3M of it before the company existed. Oria's co-founder Abdou Rachid Thiam held 12 ANR grants (€2.4M) at the ENS physics lab, almost as much as Oria's €2.7M seed round. Karavela's Bertrand Thirion held 7 (€1.6M, including a €535k AI chair) at Inria, against a €2M pre-seed. That money funded labs, not the companies.
- **The companies themselves get little direct ANR money.** They received about €1.35M as project partners, more than half of it (€0.75M) to Ksilink. Owkin and Qubit Pharmaceuticals are partners in large France 2030 research consortia (Owkin in two hospital projects worth €9–10M each, Qubit in a €36M quantum-computing programme), but their own share isn't published.
- **Twenty companies have no documented public-research link.** They're mostly AI- and data-first and recent: Bioptimus, Cure51, Rivercell, Biolevate, Spore.Bio, DeepLife, Opsin and TychoBio among them. "No documented link" doesn't mean no science. Bioptimus co-founder Jean-Philippe Vert, for example, held ANR grants as an academic.
- **Many founders are established researchers.** In at least 18 companies, a founder has five or more publications in HAL, the French open archive, under the same lab the company is linked to elsewhere. The longest records belong to Bertrand Thirion (Karavela, Inria, 274 papers), Jean-Philip Piquemal (Qubit, Sorbonne/CNRS, 197), Jean-Philippe Vert (Bioptimus, 137) and Anne Poupon (MAbSilico, CNRS Tours, 109).
- **Only two companies sponsor a registered clinical study.** Cure51 leads an observational study of exceptional long-term cancer survivors with Gustave Roussy, Centre Léon Bérard and three other European cancer centres (NCT06160596). Owkin leads a multimodal oncology data-collection study (NCT06625203). Neither tests a treatment.

| COMPANY | PUBLIC RESEARCH LINK | PATENT CO-OWNERS | FAMILIES | PRIZES |
|---|---|---|---|---|
| Aqemia | École normale supérieure - PSL, Université PSL, Sorbonne Université, CNRS + | – | 2 | i-Lab 2020 |
| Ariana Pharma | Institut Pasteur (2003 spin-off), Université de Montpellier Paul-Valéry, Université de Montpellier, Inria + | Inserm, AP-HP, CNRS | 3 | i-Nov 2025 |
| BeLiver | Institut d'oncologie de Bordeaux | – | – | i-Lab 2026 GP |
| Cherry Biotech | Université PSL, Sorbonne Université, CNRS + | BioSense Institute (Serbia) | 8 | i-Lab 2016 |
| DNA Script | Structural biology unit (UPMC, Paris Diderot, CNRS) | CNRS, Institut Pasteur | 66 | i-Lab 2014, 2016 · i-Nov 2018 |
| Eligo Bioscience | MIT | Institut Pasteur, Kantonsspital St Gallen (Switzerland) | 30 | i-Lab 2014 |
| Generare | Université Paris Cité | – | 1 | i-Lab 2024 |

| COMPANY | PUBLIC RESEARCH LINK | PATENT CO-OWNERS | FAMILIES | PRIZES |

| Oria Bioscience | Laboratoire de physique de l'ENS, Université PSL, Université Paris Cité, Sorbonne Université, CNRS + | – | – | i-Lab 2024 |
| Owkin | Université de Montpellier, CNRS, Université Paris-Saclay, CEA + | Centre Léon Bérard | 12 | – |
| Parean Biotechnologies | Université Paris Cité, Inserm | – | – | – |
| Phagos | INRAE, Université de Versailles Saint-Quentin + | – | – | i-Lab 2022 GP |
| Poietis | Bioingénierie Tissulaire, Université de Bordeaux, Inserm | Inserm, Université de Bordeaux, CHU de Bordeaux, Fondation Bordeaux Université, KU Leuven | 12 | i-Lab 2012, 2014 |
| Qubit Pharmaceuticals | Laboratoire de chimie théorique, Sorbonne Université, CNRS, Université Grenoble Alpes, CEA + | CNRS, Sorbonne Université | 16 | i-Lab 2020 · i-Nov 2021 |
| Theremia | Sorbonne Université, AP-HP, Inserm, CNRS | – | – | i-Lab 2025 |
| WhiteLab Genomics | | Généthon | 2 | – |

"Public research link" combines the parent institutions in the ministry's start-up list (lists marked + were cut off by the data service), the research unit named on i-Lab awards, and documented spin-off origins.

# Public money beyond equity

Grants and research-tax approvals from EU and French public sources. None of this is in the equity totals above.

**€31M**
in EU research grants to 15 companies (company share, Horizon 2020 and Horizon Europe)

**5**
EIC Accelerator grants of about €2.5M each, since 2021

**€1.35M**
in ANR grants to 11 companies as project partners

**10 / 48**
approved as research bodies for the research tax credit (CIR)

| COMPANY | EU GRANTS €M | EIC OR SME INSTRUMENT €M | PROJECTS | MAIN PROJECTS |
|---|---|---|---|---|
| Cherry Biotech | 8.4 | 6.3 | 18 | ASTEROID (EIC Accelerator), PLAST_CELL (EIC Pathfinder), MicroFSMA (Marie Skłodowska-Curie), ActiveMatter (Marie Skłodowska-Curie) and 14 more |
| Owkin | 4.2 | – | 5 | ImmunAID (Research and Innovation action), BIGPICTURE (Research and Innovation action), OPTIMA (Research and Innovation action), MAESTRIA (Research and Innovation action) and 1 more |
| Iktos | 3.2 | 2.5 | 3 | CARE (Research and Innovation action), AIR-3D (EIC Accelerator), MELLODDY (Research and Innovation action) |
| InSpek | 2.9 | 2.9 | 2 | MultiSpek (EIC Accelerator), ALUVia (EIC Transition) |
| Scienta Lab | 2.8 | 2.5 | 2 | AutoPiX (Research and Innovation action), PRISM (EIC Accelerator) |
| Qubit Pharmaceuticals | 2.8 | 2.5 | 2 | QEC4QEA (Research and Innovation action), ATLAS (EIC Accelerator) |
| Eligo Bioscience | 2.8 | 2.8 | 1 | SPELITEC (SME Instrument) |
| Poietis | 2.1 | – | 3 | JOINTPROMISE (Research and Innovation action), ASCTN-Training (Marie Skłodowska-Curie), Pan3DP (Research and Innovation action) |
| DeepLife | 0.7 | – | 2 | TAME (Marie Skłodowska-Curie), spaXio (Marie Skłodowska-Curie) |
| Parean Biotechnologies | 0.4 | – | 1 | HORUS (Research and Innovation action) |
| Peaccel | 0.3 | – | 1 | ELEGANCE (Marie Skłodowska-Curie) |

| COMPANY | EU GRANTS €M | EIC OR SME INSTRUMENT €M | PROJECTS | MAIN PROJECTS |
|---|---|---|---|---|
| MAbSilico | 0.2 | 0.2 | 1 | ABCardionostics (EIC Pathfinder) |
| Orakl Oncology | 0.2 | – | 1 | OASIS (Research and Innovation action) |
| AI-biopharma | 0.1 | – | 1 | CARE (Research and Innovation action) |
| Netri | 0.1 | – | 1 | NAMWISE (Coordination and support action) |

- **Cherry Biotech is the surprise leader.** The small Montreuil organ-on-chip company has taken €8.4M from 18 EU projects: two EIC grants of €2.5M (IDEFIX in 2022, ASTEROID in 2024), two EIC Pathfinder projects, and a long run of Marie Skłodowska-Curie research fellowships and training networks. Its only recorded equity round is a seed round with no disclosed amount.
- **The EIC Accelerator is the main EU door.** Qubit (2021), Cherry (2024), Iktos (2024), InSpek (2024) and Scienta Lab (2025) each won about €2.5M in grant money. The EIC can also take equity, which isn't covered here. Eligo had a comparable €2.8M SME Instrument grant in 2019. Ksilink was selected for a 2024 EIC Accelerator but no grant amount is recorded.
- **Owkin's EU money came through big consortia.** It took €4.2M as a partner in five Horizon 2020 health and IMI projects, mostly MELLODDY (€2.7M), a federated-learning project with ten drugmakers.
- **Ten companies are approved research providers for the CIR,** so clients can claim the research tax credit on work they buy from them: Ksilink, Ariana, Parean, Qubit, MedInsights, AI-Biopharma, Poietis, InSiliBio, Iktos and Netri. InSiliBio and MedInsights are also approved for the innovation tax credit (CII). Approval says a company sells research services, not how much it earns from them.

EU figures are each company's own share of the EU contribution, from the research ministry's scanR database (CORDIS data). ANR figures are partner shares from the ANR's open data. CIR and CII approvals come from the ministry's published lists of approved bodies.

# Companies to watch

## In court proceedings

From the official gazette of company notices (BODACC), checked against each company's SIREN.

| COMPANY | PROCEDURE | SINCE | DETAIL |
|---|---|---|---|
| Ksilink | Judicial liquidation | 2026-09 | Safeguard (June 2026), then receivership (July), then liquidation (28 Sept 2026) |
| Iktos | Receivership | 2026-10 | Cessation of payments 18 Sept 2026; Paris court |
| Ariana Pharma | Receivership | 2026-09 | Cessation of payments 31 July 2026; observation period to 8 March 2027 |
| Poietis | Judicial liquidation | 2025-01 | Receivership July 2024; sale plan for the business approved 21 Jan 2025 |

## No round recorded since mid-2024

These may be due to raise, raising quietly, or missing from the database. Check before reporting.

| COMPANY | LAST ROUND | TOTAL €M |
|---|---|---|
| Ariana Pharma receivership | Series A, 2008-07 | 2.1 |
| Poietis in liquidation | Series A, 2018-03 | 5.0 |

## Data gaps and method

- **Corrected on 7 November 2026.** Aqemia, Bioptimus and Owkin were corrected from press releases and company figures. Owkin's rounds now match its own figures: $2.1M seed, $72M Series A, $230M

Series B. $18M of its Series A (GV in 2018, F-Prime and Eight Roads in 2019) is recorded as one estimated entry, because the split was never disclosed. Its Bristol Myers Squibb round counts only the $50M equity part of an $80M deal.

- **Dollar rounds are converted** at the approximate euro exchange rate for the month announced, so euro totals can differ slightly from figures in the press.
- **Totals may still be a floor.** Iktos, Qubit Pharmaceuticals and others may be missing rounds. Rivercell's, WhiteLab Genomics' and Rosetta Omics' latest amounts are estimates. Grants (Aqemia's France 2030 award, Peaccel's regional grant) are excluded from totals.
- **Iktos corrected on 10 November 2026** from an editor-supplied funding history: its 2023 Series A is €15.5M, and a €0.9M Bpifrance loan (2021) is recorded as debt and left out of the equity totals.
- **Rounds stored as €0** (Eligo 2017) are treated as undisclosed. Investor names were merged where the same fund appears under two spellings (e.g. Sofinnova / Sofinnova Partners).
- **Founding year** is the registration date of the French legal entity from the national registry (recherche-entreprises.api.gouv.fr), which can be later than when the team started. Three companies (DeepLife, Endogene.bio, Scienta Lab) have no SIREN in the database.
- **Founders are recorded for all 48 companies.** Tebuna's three founding shareholders (Millie Heo, its president, with 95.7%, plus Cyril Touffet and Michel Popielarz) come from its founding statutes. Founder records were cleaned on 10 November 2026: names stored together in one record (Bioptimus, Spore.Bio, Netri) were split, and duplicates removed.
- Headcount bands are the registry's 2024 figures for the French entity only.
- **Patents** come from the research ministry's patent-applicant dataset, completed on 7–8 November 2026 by a full search of INPI's patent database (French, European and international publications) for every company, checked by SIREN or exact applicant name with a French address. That added 41 families, mostly 2024–26 filings, and real titles for all but 10 families. Look-alikes (Nebula Inc, Endogene Ltd, Opsin Biotherapeutics Inc) were rejected; Owkin Inc, the US parent, is counted as Owkin. Applications publish about 18 months after filing, so the newest filings may still be missing.
- **EU grants** are each company's own share in Horizon 2020 and Horizon Europe projects, from scanR (CORDIS data). Projects where the share is zero or unrecorded are left out. EIC equity investments are not included.
- **Court proceedings** come from BODACC notices matched on SIREN. A first name-based search returned false matches (a 2019 notice and an unrelated restaurant), which were discarded.
- **Publications** are counted from HAL only where the founder's affiliations match the lab already linked to the company. Common names (e.g. Eric Durand) were not counted.
- **The ANR grant search is incomplete:** about a quarter of founder surnames, the 2005–09 grants and most France 2030 programme searches were not run, so the €8.4M founder total is a floor. Amounts are the partner's share of each project. For Owkin's and Qubit's France 2030 consortia only the consortium totals are published.
- **The official public-research start-up list** matched DNA Script only under an older, closed company number. Rivercell appears under its former legal name, Blossom Life Sciences.
